

SEO Audit — Comparison Report

Origin Tours & Travels · origintoursandtravels.com — what changed between the two audits

v1: earlier audit (6 specialists, commit `1a63b0b00`) → v2: current audit (10 specialists + live verification, 29 May 2026)

Headline: Health Score 59 → 69 (+10)

This is a real before/after, not two views of one snapshot. After v1 was written, the dev shipped fixes that directly target its findings — git commits `7bad41d` “legal pages added” and `3d06b10` “H-1a complete – detail content now server-rendered” both land *after* the v1 report commit. The gains below are **git- and live-verified**, not scoring noise — though some delta also comes from v2 using 10 specialists vs v1’s 6, plus live verification.

Category scorecard

CATEGORY	WEIGHT	V1	V2	Δ	V2 LEVEL
AI Search Readiness	10%	42	62	+20	
Performance (CWV)*	10%	50	65	+15	
On-Page SEO	20%	58	72	+14	
Technical SEO	22%	68	78	+10	

CATEGORY	WEIGHT	V1	V2	Δ	V2 LEVEL
Schema / Structured Data	10%	65	75	+10	
Content Quality (E-E-A-T)	23%	61	62	+1	
Images	5%	60	55	-5	
Overall		59	69	+10	

* Performance rose on shipped structural fixes (SSR carousels, removed idle Tawk WebSocket, GTM defer) but is still an **estimate** — neither audit had CrUX/PageSpeed field data. Images fell because a new hard regression (OG image 404) outweighs v1's milder "logo points to OG image" note.

✓ Fixed since v1 — verified

RESOLVED C-3 · Legal pages now exist

v1: no Privacy/Terms/Refund pages — a hard QRG + DPDPA failure for a site collecting inquiries.

Now live: `/privacy` , `/terms` , `/refund` all return 200.

Verified: live HTTP 200 · commit `7bad41d` "legal pages added"

RESOLVED H-1a · Detail content is now server-rendered

v1: tour/visa detail pages fetched body content in `useEffect` (skeleton on first paint, JS-gated).

Now: detail pages SSR their content; the tour detail page ships `TouristTrip` +

`BreadcrumbList` in initial HTML.

Verified: live `curl` of `/tours/kashmir-tour-package-from-hyderabad` · commit `3d06b10` "H-1a complete"

RESOLVED H-3 · Schema type misuse (Product → TouristTrip/Service)

v1: tours/visas used `Product` schema, forfeiting travel rich-result eligibility. **Now:** tours use

`TouristTrip` , visas/attestation use `Service` — correct types throughout.

Verified: live schema scan + v2 schema specialist

RESOLVED H-8 · llms.txt added (and it's strong)

v1: no `llms.txt` . **Now:** `/llms.txt` returns 200 with specific pricing, visa timelines, NAP and accreditations — better than 90% of travel-agency sites per the v2 GEO specialist. (Main driver of the +20 AI-readiness jump.)

Verified: live HTTP 200

RESOLVED **M-3 · BreadcrumbList rolled out beyond /hajj**

v1: breadcrumbs only on `/hajj`. **Now:** `BreadcrumbList` on all service + detail pages.

Verified: v2 schema specialist + live scan

IMPROVED **H-4 · Performance — structural fixes shipped**

v1: `HeroSlideCarousel` `ssr:false`, heavy `three.js` `Globe`, idle `Tawk` `WebSocket` blocking `bfcache`. **Since then:** SSR-friendly static-grid carousels with scroll-hydration, removed the idle `Tawk` timer, `GTM/GA` defer, font-flash fix. Still needs a real `CrUX/Lighthouse` run to confirm p75.

Commits `d6f0742`, `8758087`, `57c714c`, `becb817`

● Carried forward — still open in v2

OPEN **Trust signals — fabricated testimonials & unverifiable “4.9 / 99%”**

v1 **C-1** → v2 **C2**. Still hardcoded testimonials with no source; “4.9” and “99% visa success” remain unbacked. Top `YMYL` trust risk.

OPEN **Credentials are still text-only / no team**

v1 **C-2** → v2 **H3**. No `IATA/TAAI/Hajj` registration numbers, no named consultants on `/about`.

OPEN **Listing pages still thin**

v1 **H-1b** → v2 **H1**. Detail pages are fixed, but `/tours` and `/visas` listing pages remain filter-grid-only with little server-rendered editorial text.

OPEN **No `aggregateRating` schema**

v1 **H-2** → v2 **C3**. Correctly gated on real `GBP` data — needs the review-velocity program before the (already-built) helper can be wired.

OPEN **Other carry-overs**

Anonymous/near-empty blog (**H-5**); no Tier-1 India citations — `Justdial/Sulekha/IndiaMART` (**H-7**); `Maps` embed uses a text query not the `Place ID` (**M-2**); sitemap `lastmod` identical on static routes + deprecated `changefreq` / `priority` (now v2 **H5**).

New or escalated in v2

NEW / ESCALATED OG & logo image now a hard 404

v1 noted (Low) that schema `logo` pointed at the OG image. v2 live check found `/og-default.jpg` itself returns **404** — so `og:image`, `twitter:image` and schema `logo` are all broken. Escalated to **Critical (C1)**. Likely a side-effect of the recent refactors.

Verified: live `curl -I /og-default.jpg` → 404

NEW Email domain mismatch

Not in v1. v2 local specialist flagged `sales@origingroups.com` ≠ the website domain → fragments NAP/trust for directory validators. (v2 **H6**.)

NEW DETAIL Sunday hours & duplicate homepage FAQPage

Sunday `openingHoursSpecification` now present but as `00:00–00:00` (parses as “open 24h”); homepage emits the `FAQPage` block twice. Both are v2 **H4** schema fixes.

Net assessment

The team has worked through the v1 plan effectively: **3 of 3 “Wave 1/2” structural items verified done** (legal pages, SSR detail content, schema-type migration) plus `llms.txt` and breadcrumbs — driving the biggest gains in AI-readiness, on-page and schema. The **remaining ceiling is unchanged**: trust/E-E-A-T (testimonials, credentials, reviews) and thin listing-page content — which is why Content Quality barely moved (+1). The one regression — the 404 OG/logo image — is the cheapest possible fix and should be the very next action.
